

Hey there!

Thank you for downloading the asp .net C# library for junaio developers. This is an alpha library – for questions and suggestions please write to developer@junaio.com.

REQUIREMENTS

1. Server running ASP .Net

INSTALLATION

1. Unpack all files
2. Create a virtual host pointing to the directory containing Default.aspx
3. See example Web page Default.aspx
4. Add your API key to Default.aspx (JUNAIO_KEY)

SETTING UP HINTS

Thanks to maxd!

IIS_WPG permissions

to run applications successfully you must allow permissions for **IIS_WPG** these must include **read & execute**. This should be set on the folder that junaio is held though if it is not a new website in the IIS you may need to set these permissions on the root website.

IIS Application

In the IIS you must ensure the folder you have the junaio files in is set as an application. You can do this by right clicking on the folder in the IIS and clicking properties. On this section ensure there is an **application name** (mine is junaio, by default), you will also need to ensure **execute permissions** is set to **Scripts and executables**.

Attention: When using the ASP.NET library, make sure your channel's callback URL references the URL + Default.aspx -> e.g. <http://www.yourchannel.com/Default.aspx>
